

New Pleats Plus™ N95 and R95 Particulate Respirators

The Most Comfortable, Best Fitting and
Longest Lasting NIOSH Approved
Particulate Respirators

The patent pending design of Pleats Plus™ Respirators makes Pleats Plus Respirators more comfortable than any filtering facepiece with or without exhalation valve.

With the breathing resistance half that of other major brands, Pleats Plus Respirators, without exhalation valves, offer wearers the most comfortable, best fitting, and longest lasting facepieces on the market.

- Plus – Low-resistance filter material and double the surface area of most other masks make Pleats Plus easier to breathe through and better fitting.
- Plus – The larger surface area means Pleats Plus lasts longer over the course of the day than any other leading brand.
- Plus – Flexible "pleats" make communication more effective. "Pleats" do not muffle your voice like the stiff shell of a cup mask.
- Plus – Woven elastic headbands for a secure fit without pulling hair.
- Plus – One size fits a wider variety of faces than the next leading brand.

Pleats Plus™

Pleats Plus™

N95 and R95 Particulate Respirators

Comfort Means Compliance

Cool, lightweight, and comfortable, the Pleats Plus Respirators, with their patent pending design, outperform all competitors. Pleats Plus Respirators are twice as easy to breathe through and more comfortable than the next leading mask with an exhalation valve. The large surface area and the low-resistance filter material make inhalation and exhalation easy. The woven elastic headbands provide just the right amount of pull so Pleats Plus feel snug, but not tight, and hair does not get caught up in the headbands.

Its easy to talk with Pleats Plus. Built-in "pleats" flex with mouth movements and do not muffle communication like cup-style masks can.

NIOSH N95 approved Pleats Plus can be used to help protect against dusts, fumes, microorganisms, mists, and other solid and liquid particulates not containing oil. The NIOSH R95 approved version can be used to help protect against particulates containing oil*.

*Specific government regulations may require filter efficiency greater than 95% for protection from certain particulates. For example, OSHA requires N100, R100, or P100 for protection against asbestos, lead and cadmium.

Fits faces and pockets. Reduces inventories and budgets.

In recent studies, Pleats Plus N95 medium/large respirators fit 100% of the subjects in a test panel representative of US adult facial sizes. There's no need to stock a bunch of brands and sizes to fit wearers' faces—thereby decreasing inventory costs. The Pleats Plus respirators

fold instantly to hang around the neck or fit into a pocket between uses. Easy storage during breaks promotes reuse—another money saver.

The very large filtering surface area of Pleats Plus means that there is more area available to collect particulates. This allows the breathing resistance to stay lower than that of other leading brands for longer periods of time. That means wearers will not be changing masks as frequently so fewer masks will be used per day.

Prod. Code	Pleats Plus Description	Qty./Box	Boxes/Case
